Theoretical part

We decided to implement the following use case:

The user story: As a worker, I want to be able to see product information, so I will be able to know the details of the product.

Main success scenario:

1. Worker selects option number 13 in the main menu.
2. Worker selects option number 1 in the storage menu.
3. worker selects a catalog number.

Extensions:

a. Worker is not in an ongoing shift.
   a. The system sends a notification about it.
b. Worker gives a value which is not a number, or an option which does not exist, in steps 1-3.
   a. The system sends a notification about it and sends him back to the corresponding menu.
c. Worker selects an option which he does not have permission to.
   a. The system notifies him about it and sends him back to main menu.
d. Worker sets a catalog number which does not exist in the store.
   a. The system notifies him about it and sends him back to storage menu.
